01-the-vision.md

Here's your full research report for **Timed — Research Pack 01**. It covers all six questions from the brief, structured as a standalone reference document you can feed back into your build process.

Here's what each section delivers:

1. **Conceptual Architecture** — A four-layer OS model (Signal Ingestion → Tiered Memory → Reflection Engine → Delivery), with the feedback cycle as the source of compounding. MemGPT and Generative Agents are the two architectures that directly inform this design.
2. **Signal Universe** — A full table mapping every observable signal (calendar, email, voice, app focus, task timing) to the higher-order inferences extractable from it: chronotype model, avoidance signature, cognitive load proxy, relationship health, strategic/tactical ratio.
3. **Compounding & Retrieval** — The recency × importance × relevance scoring formula from Park et al., the superior ACAN dynamic cross-attention model from 2025, and the MemGPT three-tier memory hierarchy (core → recall → archival). Critically: retrieval precision beats retrieval volume.
4. **Delivery Design** — The morning session structure (pattern headline → cognitive state → day plan → one question), the curatorial vs. editorial model from CIA intelligence briefing research, and voice-first interaction principles that make it feel like a chief of staff rather than a chatbot.
5. **Failure Analysis** — A full table covering Rewind/Limitless, Humane, Rabbit r1, Clara/x.ai, and the meeting AI wave. The common thread: promising actions AI can't execute, pivoting away from your moat, and building single-session intelligence. Timed's constraint sidesteps all three.
6. **Value Architecture** — Three tiers of value (operational → intelligence → compounding strategic), the economic case for $500+/month against CEO time costs, and the specific moment that converts a sceptical Fortune 500 CEO: the first time the morning session names a pattern about their behaviour that is exactly right.
